1. Introduction

The Vault is ULF Web’s built-in case management system. It lets you organize information into cases, each containing text notes, documents, and images. The AI automatically generates descriptions and summaries to help you work with your data.

In this tutorial you will learn how to:

- Navigate to the Vault and search for cases
- Create a new case with an identifier and description
- View and manage case details
- Add text, document, and image records to a case
- Star important records and manage record lifecycle
- Export cases as PDF or JSON
- Reference vault cases in chat conversations using @mentions

Note:

This tutorial assumes you are already logged in to ULF Web. If you need help logging in, see the User Manual.

2. Navigating to the Vault

The Vault is one of the five main tools in ULF Web, accessible from the sidebar navigation tabs. Click the Vault tab to switch to the Vault panel.

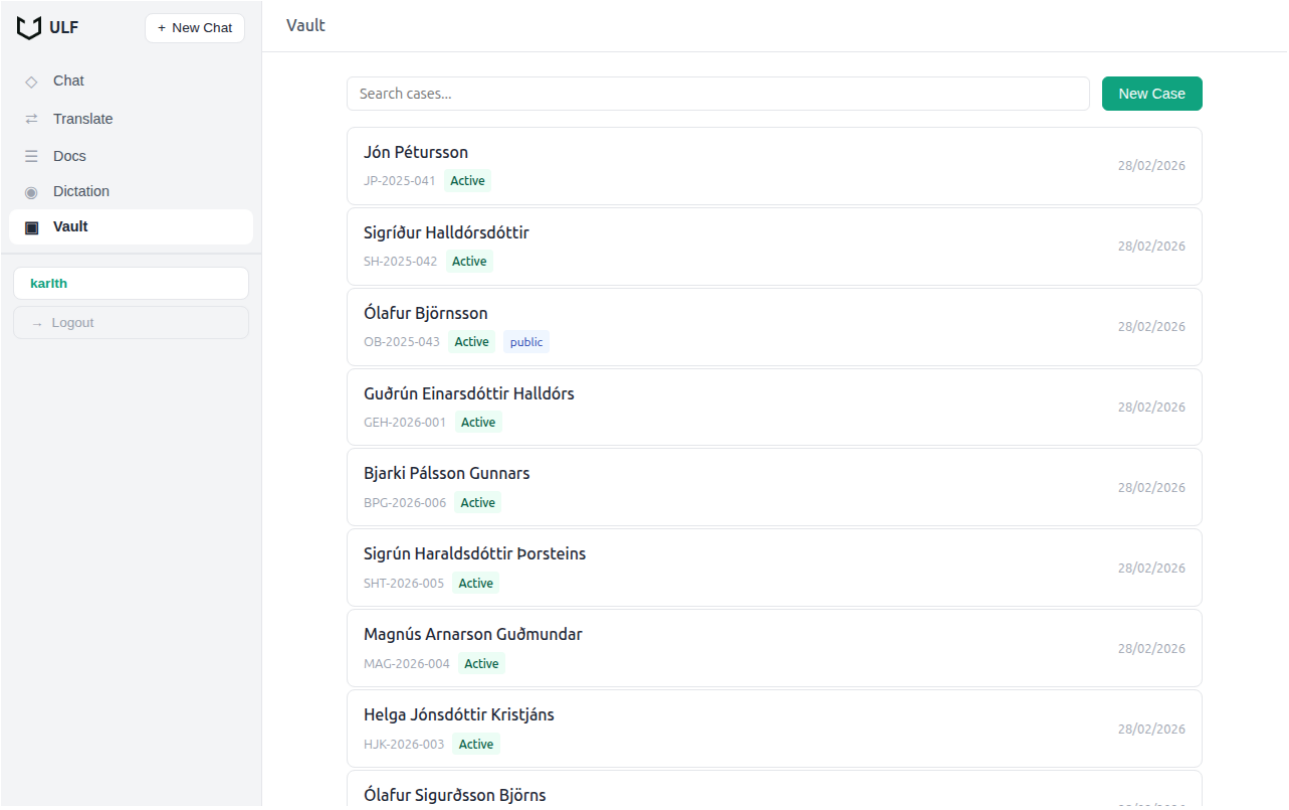

Figure 1 — The Vault panel after clicking the Vault tab

The Vault panel displays your list of cases. At the top you will find a search bar that filters cases in real time as you type. Below it is the New Case button for creating new cases.

Cases you own (created by you) and public cases created by other users are both shown in the list. Private cases are only visible to their owner.

3. Creating a Case

To create a new case, click the New Case button. A form will appear with the following fields:

- **Identifier:** A short, unique code for the case (e.g., CASE-001, INV-2026-042). This is used as a reference label.
- **Name:** A descriptive name for the case (e.g., “Smith Investigation”).
- **Description:** Optional free-text description providing background or context for the case.
- **Visibility:** Choose Public (visible to all users) or Private (visible only to you).

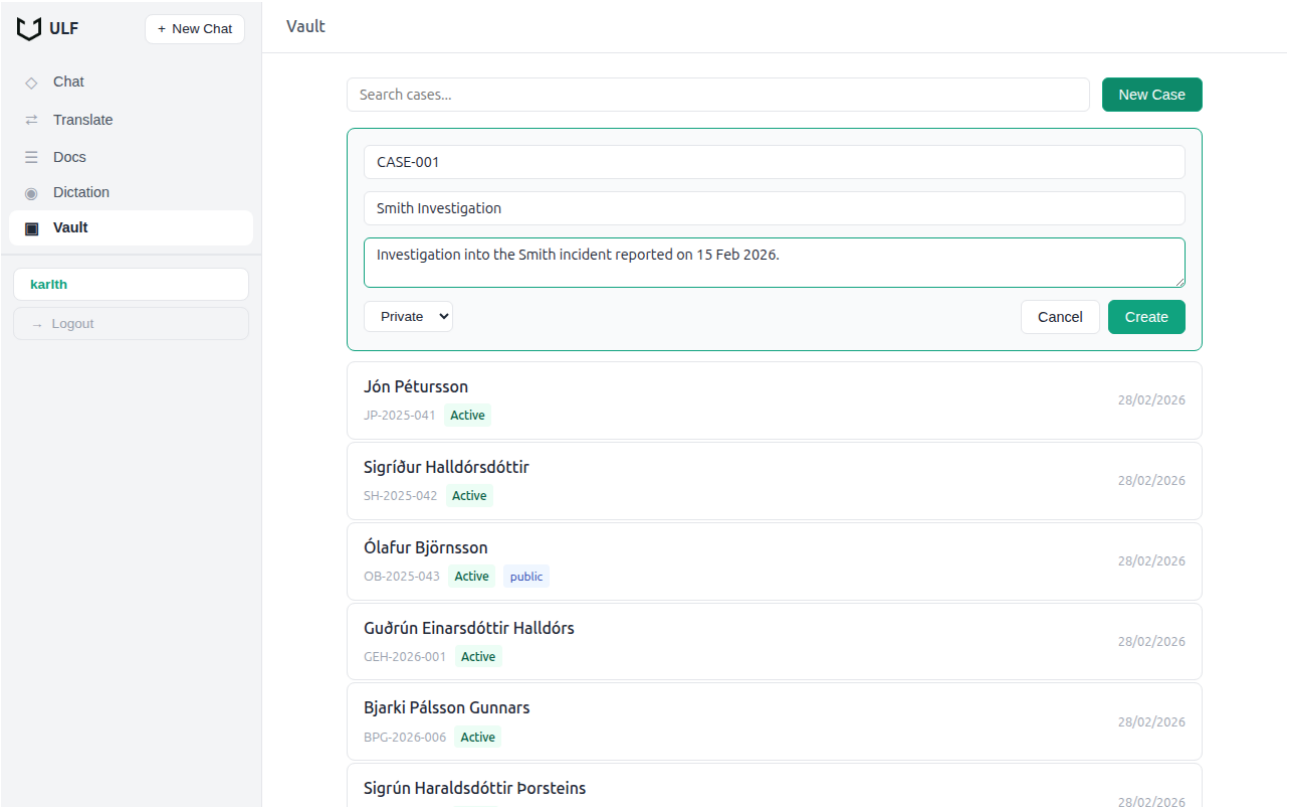

Figure 2 — The new case form with fields filled in

Click Create to submit the form. The new case appears immediately in the case list.

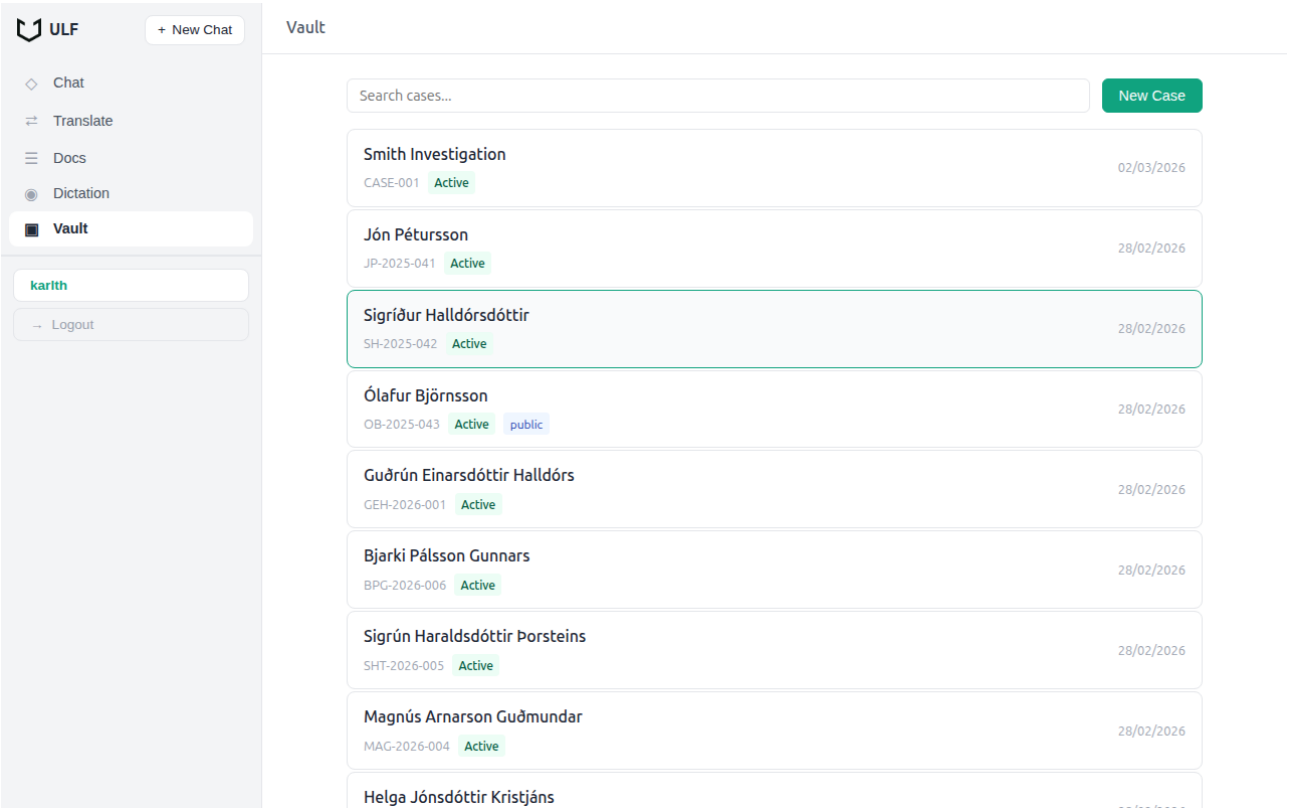

Figure 3 — The case list showing the newly created case

4. The Case Detail View

Click on a case in the list to open its detail view. The detail view shows:

- The case identifier, name, and status at the top
- An AI-generated summary (updated automatically as records are added)
- Action buttons for adding records, exporting, and managing the case
- A chronological list of all records in the case

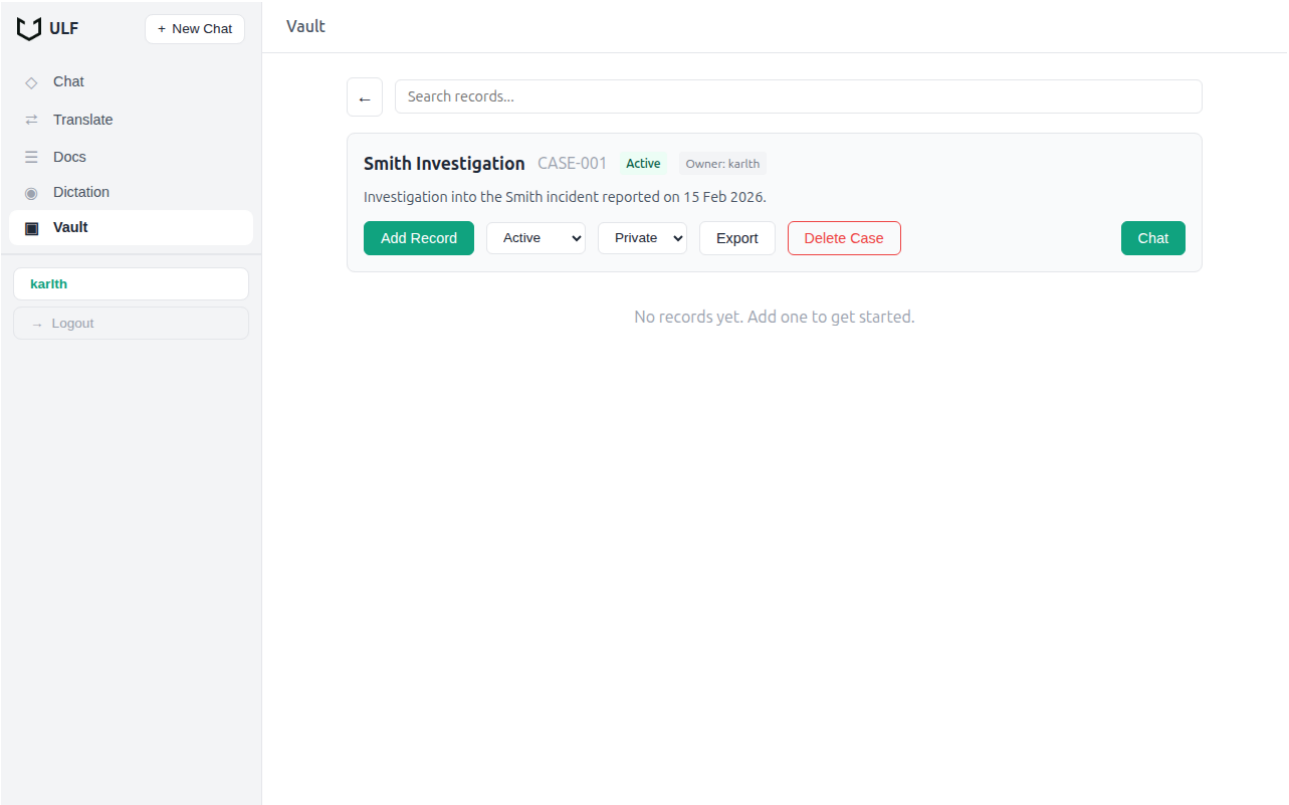

Figure 4 — The case detail view

The case status can be Active, Closed, or Archived. Active cases are open for editing. Closed cases are preserved for reference. Archived cases are stored long-term.

5. Adding Records

Records are the individual pieces of information stored in a case. ULF Web supports three types of records:

- **Text:** Free-form text notes with a title, date, and content. Ideal for interview notes, observations, or summaries.
- **Document:** PDF files uploaded to the case. The AI automatically generates a summary of the document content.
- **Image:** Image files (JPEG, PNG). If a vision-capable model is configured, the AI automatically generates a description.

Adding a Text Record

Click the Add Record button to open the record form. Select the record type (Text is the default), then fill in the title and content.

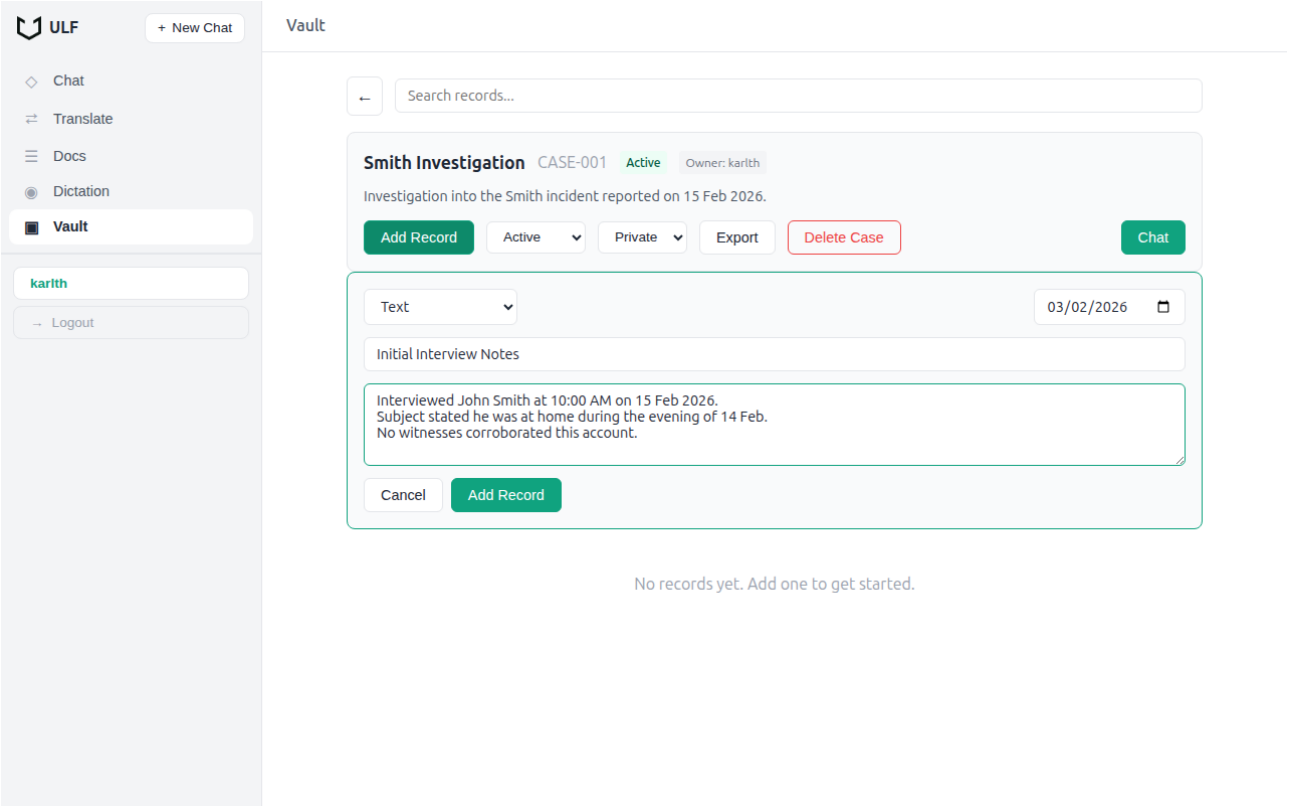

Figure 5 — The add record form with a text record

Click Submit to save the record. It appears in the record list below the case details. You can add as many records as needed.

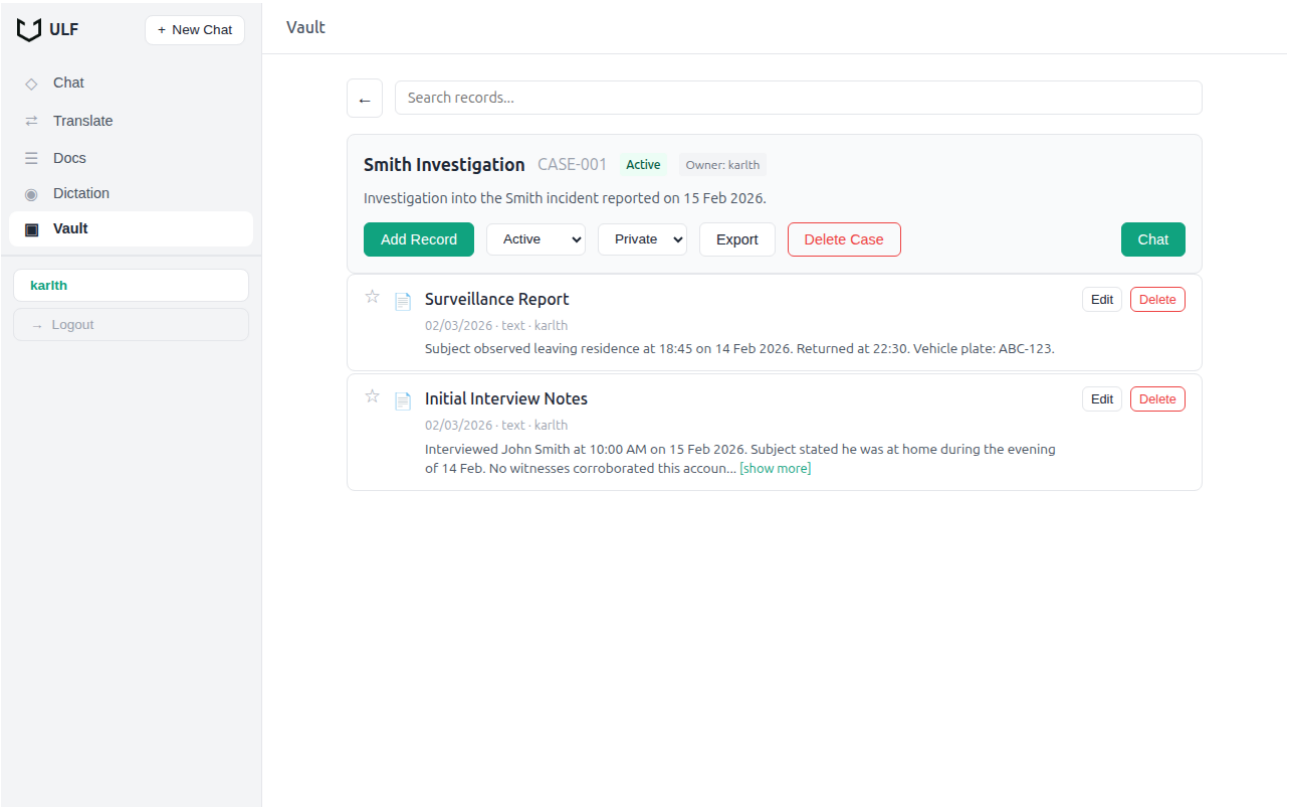

Figure 6 — The case with two text records

Uploading Documents and Images

To upload a document or image, change the record type dropdown to Document or Image. A file upload area appears where you can click to browse or drag-and-drop a file. The AI will process the file in the background after upload.

6. Working with Records

Starring Records

Click the star icon on any record to mark it as important. Starred records are visually highlighted, making them easy to spot in long case files. Click the star again to remove the highlight.

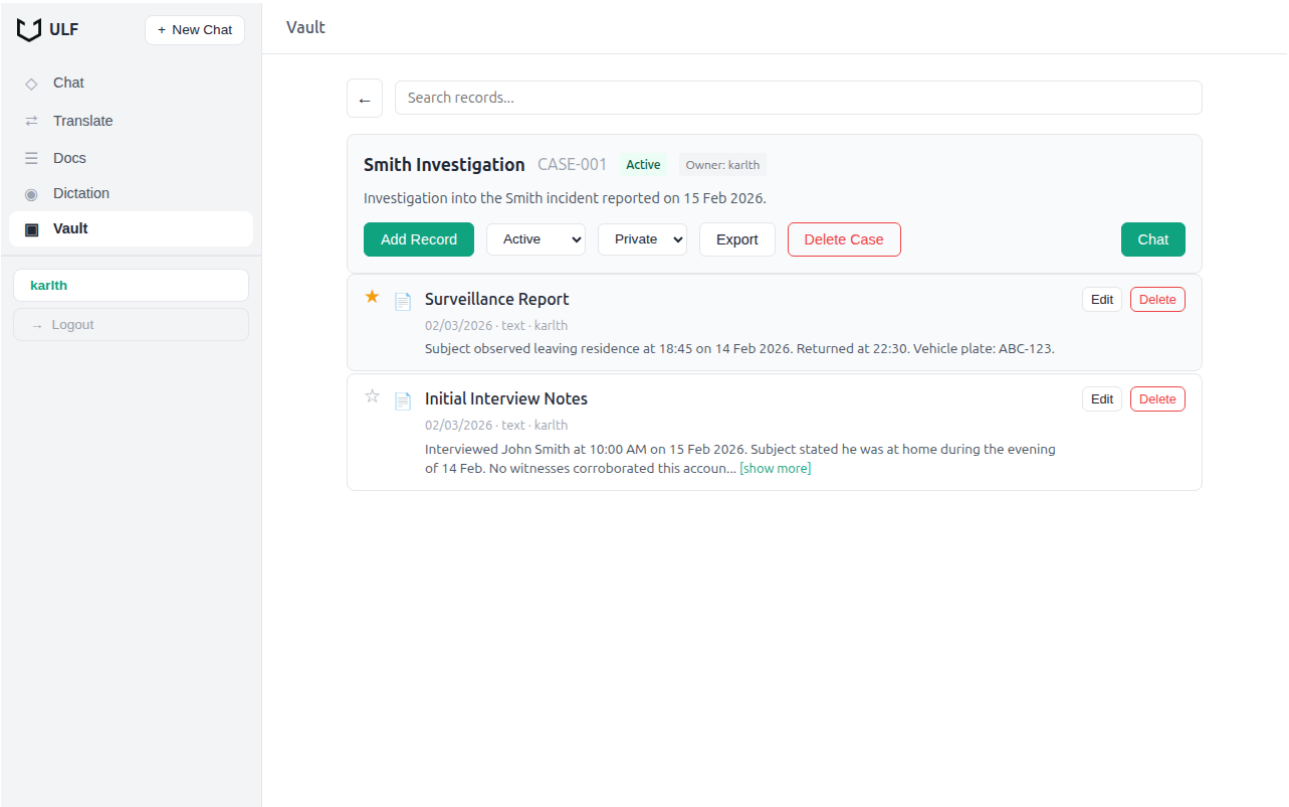

Figure 7 — A starred record highlighted in the list

Editing Records

Text records can be edited within 24 hours of creation. Click the edit button on a record to modify its title or content. After 24 hours, records are locked to preserve the integrity of the case history.

Deleting Records

Click the delete button on a record to permanently remove it from the case. You will be asked to confirm before the record is deleted. The AI case summary is automatically updated after deletion.

7. Exporting Cases

ULF Web provides three export formats for sharing or archiving cases. Click the Export button in the case detail view to see the options.

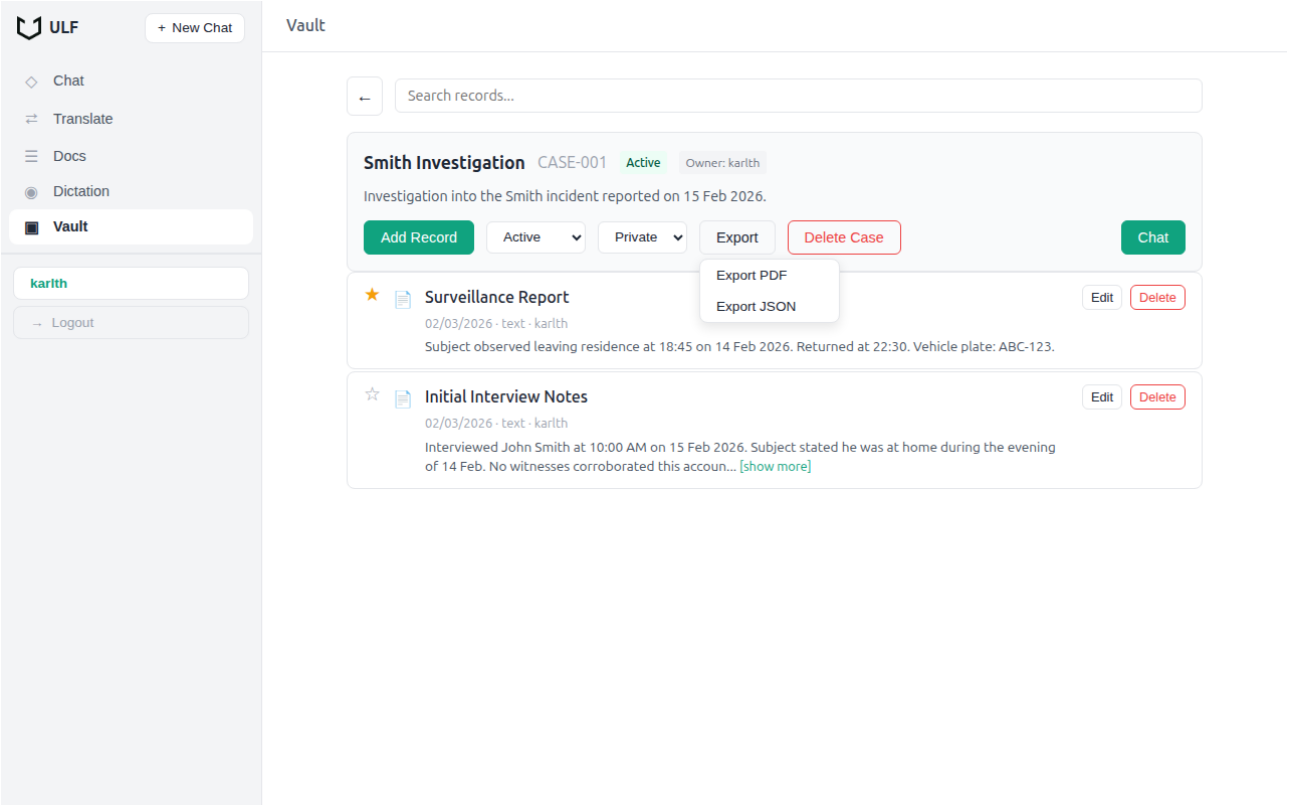

Figure 8 — The export dropdown menu

PDF Export

Generates a formatted PDF document containing the full case: metadata, description, AI summary, and all records with any embedded images and documents. Ideal for sharing with colleagues or printing.

Redacted PDF Export

Generates a PDF with personally identifiable information (PII) automatically scrubbed. The case name and identifier are replaced with generic labels, and text fields are processed to replace email addresses, phone numbers, Icelandic national IDs (kennitala), street addresses, postal codes, company names, dates, and other PII with placeholders such as {{KENNITALA}}, {{ADDRESS}}, {{EMAIL}}, and {{COMPANY}}. Images and document attachments are excluded entirely, replaced with a note indicating the omission. The exported filename uses the case ID only, avoiding any PII in the filename itself.

JSON Export

Exports the case data as a structured JSON file containing all text content, metadata, timestamps, and record details. Useful for backups, data migration, or programmatic analysis.

8. Using Vault Cases in Chat

One of the most powerful features of the Vault is the ability to reference cases directly in chat conversations. This injects the case's recent records as context, allowing the AI to answer questions about your case data.

The @Mention Syntax

In the chat input, type the @ symbol followed by part of the case name or identifier. An autocomplete dropdown appears showing matching cases.

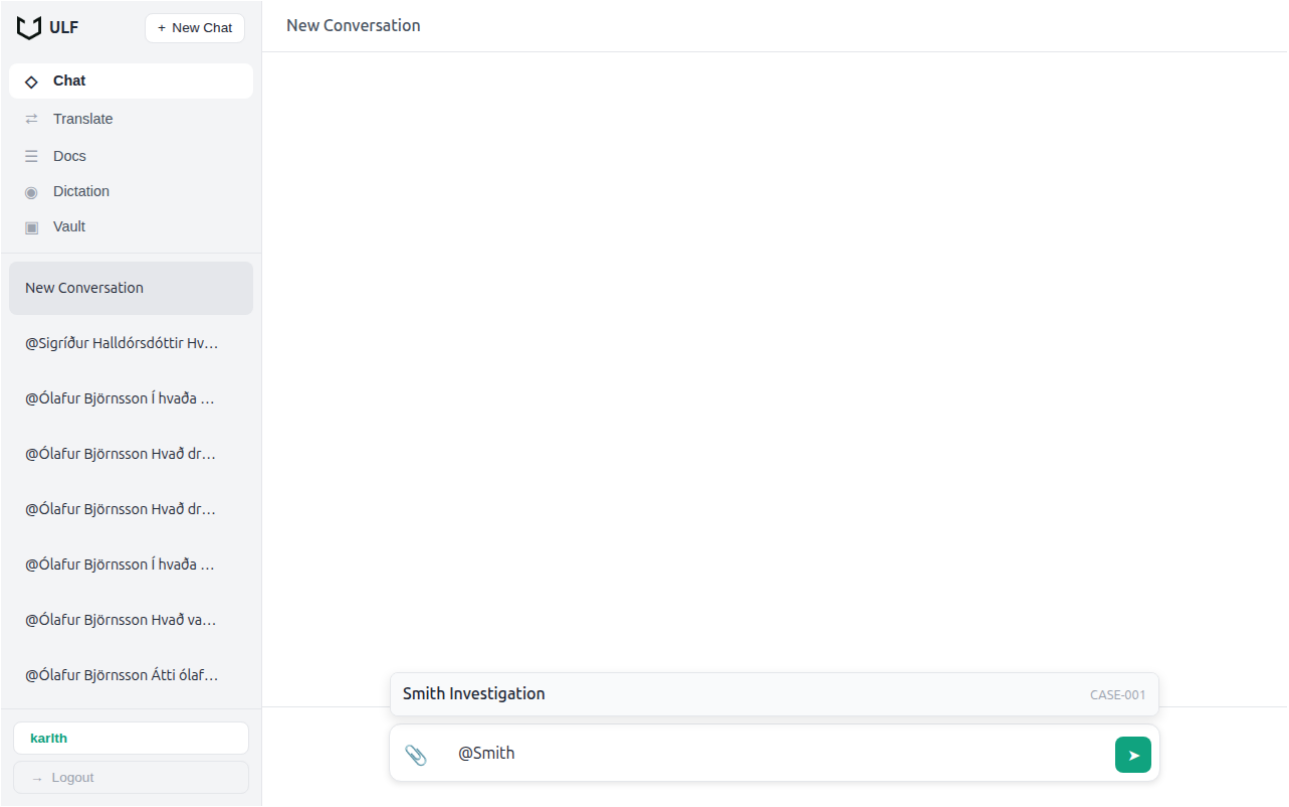

Figure 9 — The @mention autocomplete dropdown

Click on a case in the dropdown (or use the arrow keys and Enter) to insert the @mention into your message.

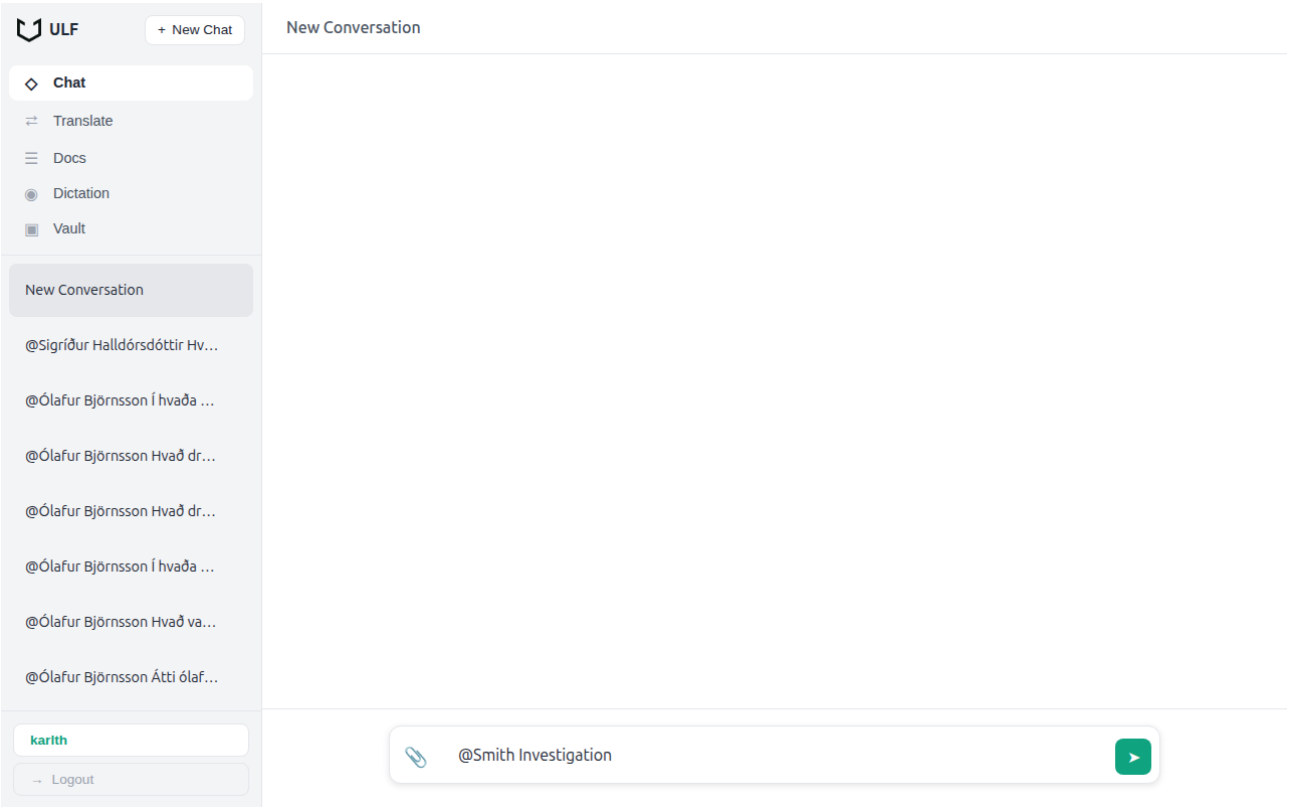

Figure 10 — A completed @mention in the chat input

How Context Injection Works

When you send a message containing one or more @mentions, ULF Web retrieves the recent records from each referenced case and includes them as context in the conversation. The AI can then reason about the case data alongside your question.

The number of records included is controlled by the administrator in the Vault settings (default: 10 most recent records). Starred records are always prioritized.

Example Use Cases

- "@Smith Investigation — Summarize the key findings so far"
- "Based on @CASE-001, are there any contradictions in the witness statements?"
- "Compare the timelines in @CASE-001 and @CASE-002"

Note:
You can reference multiple cases in a single message. Each case’s records are injected separately, allowing the AI to cross-reference information across cases.
